

Patient Spirometry

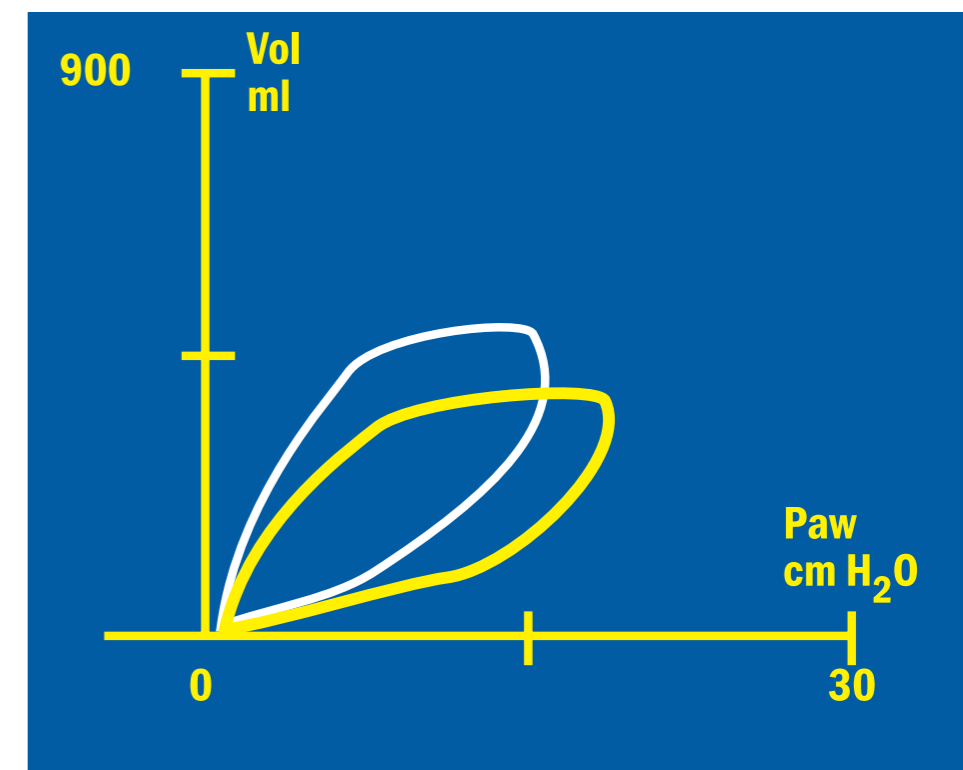

Determining if a patient's ventilatory status has changed

Initial status

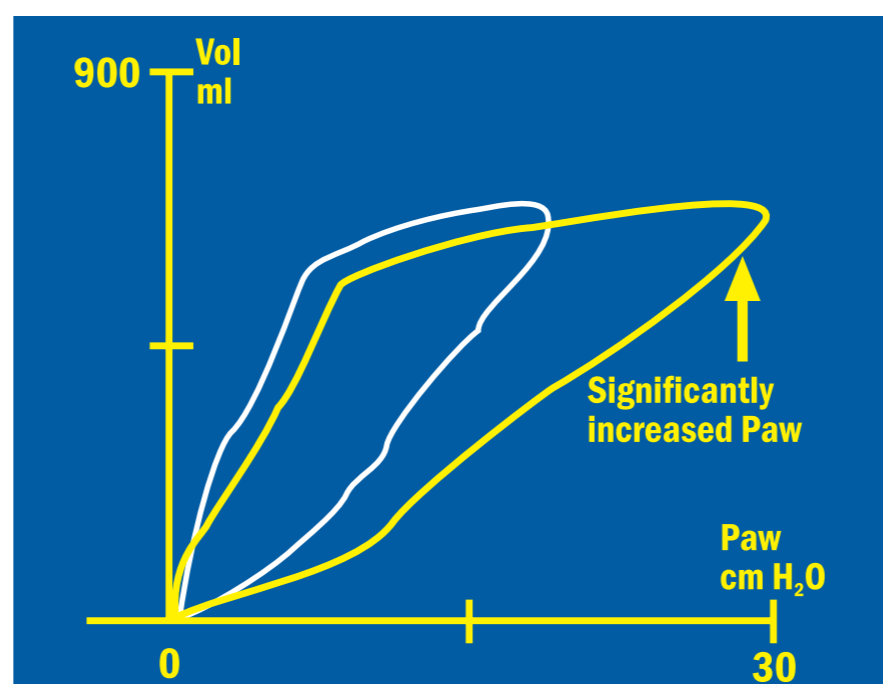

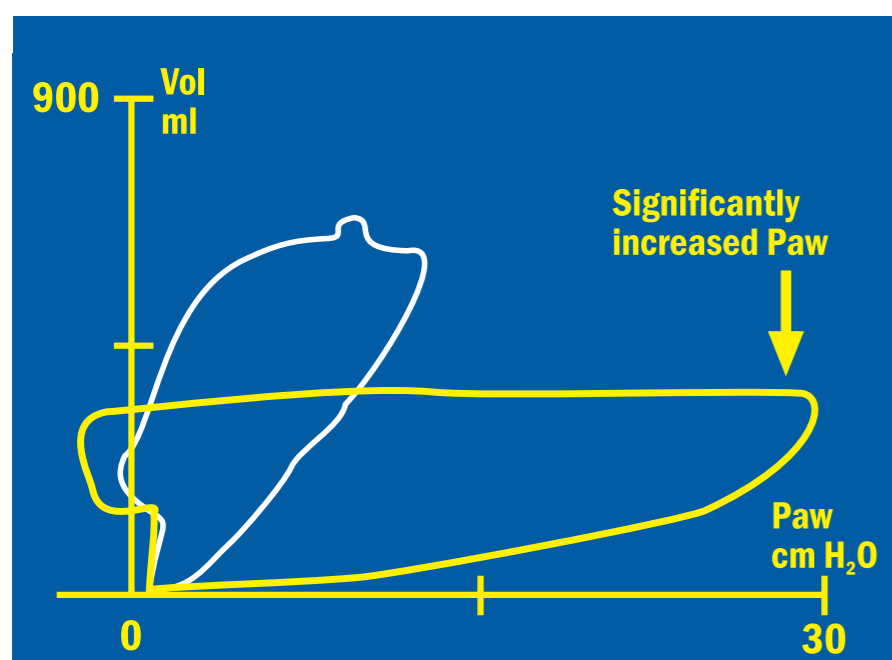

You can determine if your patient's ventilatory status has changed by comparing the current loop with one you have already saved. Using a single sensor at the patient's airway, Patient Spirometry enables you to evaluate your patient's ventilatory status, breath by breath, reliably and easily, regardless of the type of ventilator.

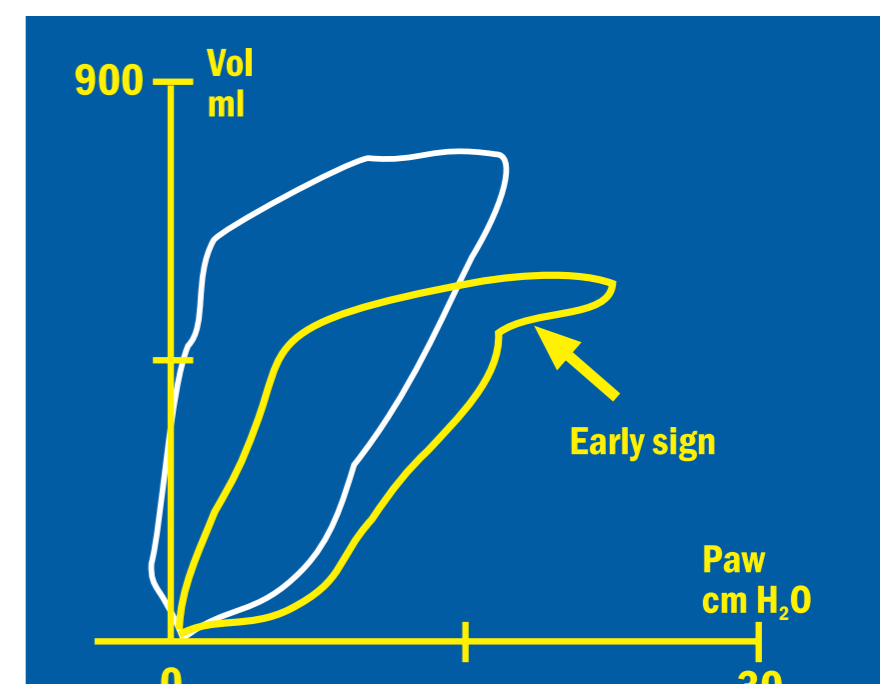

Changed status

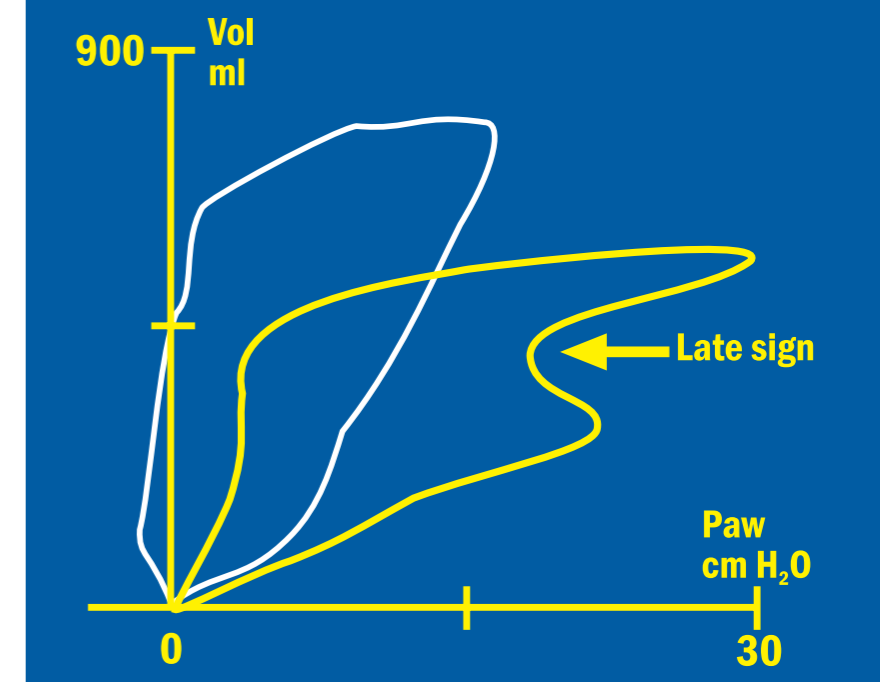

Clinical examples

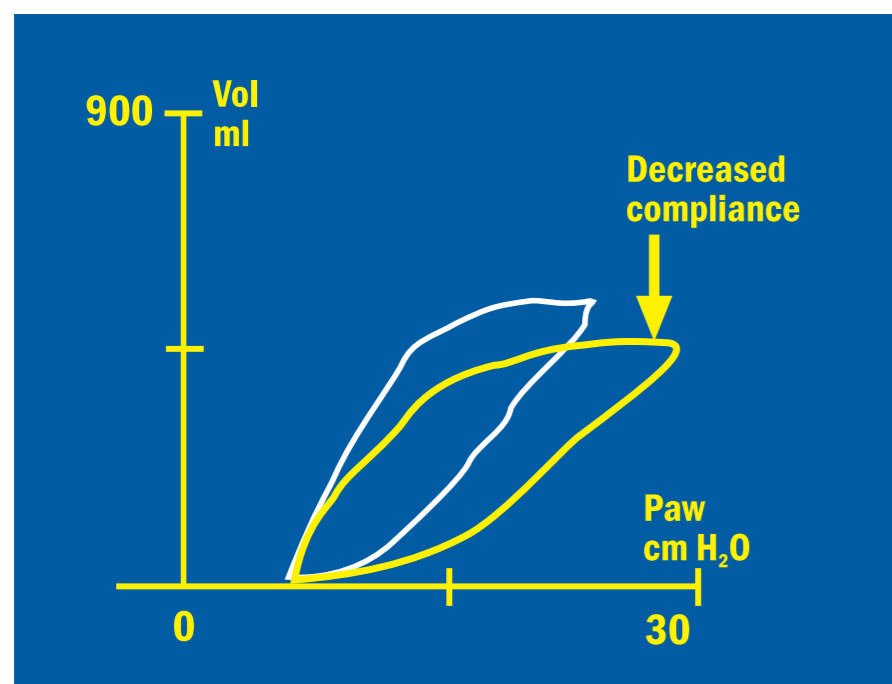

Unintentional one-lung intubation

Cuff or laryngeal mask leak

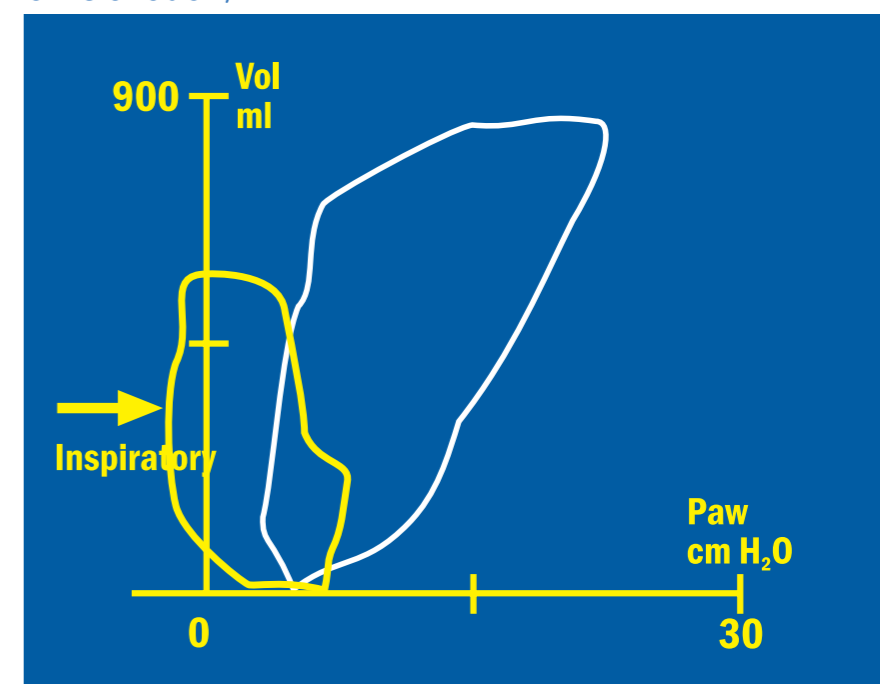

Patient breathing against ventilator (e.g. lack of relaxation)

Bronchospasm

See Patient Spirometry Appliguide for more clinical cases.

Spontaneous breathing
