Arrhythmia Recognition (poster 1 of 2)

This poster is part of an extensive educational module on arrhythmia recognition. It is designed as a tool for physicians and nurses to enhance their understanding of heart rhythms and their associated conditions.

The ECG (electrocardiogram) is a crucial diagnostic tool for evaluating heart rhythms. This poster aims to provide a comprehensive overview of various arrhythmias, their diagnosis, and treatment options. It includes detailed information on normal and abnormal cardiac rhythms, as well as representations of different types of heart contractions and disconnections.

Key Features:
- Normal sinus rhythm and atrial rhythms
- Premature atrial complexes and atrial flutter
- Atrial fibrillation and atrial tachycardia
- Pre-ectopic syndrome and ventricular rhythms
- Conduction defects and mechanical events

The information is structured to aid in the recognition and classification of arrhythmias, helping healthcare professionals to make informed decisions about patient care.
